THE QUESTION

How did reported container port throughput differ and change across economies, and how steady were those changes year to year?

Five-year throughput trend

101 economies with complete data · million TEUs

Scale begins at 780M TEUs (truncated); annual values are labeled. 2020–2024: +126.2M TEUs (+16.2%).

Key findings

Q1–Q2 | LEADERS & RANKS

China ranked first in 2024 at 299.7M TEUs, about five times the United States. The top five ranks held; Viet Nam rose 11th to 6th.

Q3 | INCREASES

China had the largest absolute gain (+59.2M TEUs). Côte d'Ivoire had the largest percentage gain (+84.0%); Morocco ranked highly on both.

Q3 | DECLINES

China, Hong Kong SAR recorded the largest absolute decline (–4.3M TEUs). Myanmar had the largest percentage decline (–28.5%, about 312,000 TEUs).

Q5 | VARIABILITY

Haiti's year-to-year percentage changes were most consistent (SD 1.6 percentage points); Djibouti's were most variable (SD 33.1 points).

Implications for follow-up

- Use large absolute increases to prompt port capacity and utilization review; interpret percentage growth alongside starting volume.
- Compare these patterns with regional trade-agreement developments and liner capacity deployments; this analysis does not test causes.

SCOPE & INTERPRETATION

UNCTADstat annual TEU data, 2020–2024. 136 economies; 88/680 economy-year values unavailable. Trend chart: 101 complete-series economies, not a global total. Throughput measures port activity, not overall national economic performance; results do not establish causes.
